9.4 Sequences & Series
Target 7D: Calculate the sums of finite and infinite series

Review of Prior Concepts

1. Find the 100th term in the following sequence of numbers.
   a) 2,5,8,11, ...   b) 2,4,8,16, ...

2. Find the sum of the 1st 100 positive integers.

SAT Connection
Heart of Algebra
8. Interpret the variables and constants in expressions for linear functions within the context presented.

Example:

$$a = 18t + 15$$

Jane made an initial deposit to a savings account. Each week thereafter she deposited a fixed amount to the account. The equation above models the amount a, in dollars, that Jane has deposited after t weekly deposits. According to the model, how many dollars was Jane's initial deposit? (Disregard the $ sign when gridding your answer.)
NOTE: You may start your answers in any column, space permitting. Columns you don't need to use should be left blank.

Solution

Summation/Series

Summation (or Series) - sum up the terms of a sequence

Summation Notation

$$\sum_{k=1}^{n} a_k =$$

"The sum of a_k from $k = 1$ to n."

"The series a_k from $k = 1$ to n."

Example 1: Find the value of:

$$\sum_{k=2}^{5} 3k$$

Example 2: Write the summation $2 + 5 + 8 + 11 + \cdots + 29$ in sigma notation.

Example 3: Write the series $5 - 15 + 45 - 135 + \cdots$ in sigma notation.

Sum of the Terms in an Arithmetic Sequence

Proof

Start with the sum of an arithmetic sequence

$$\sum_{k=1}^{n} a_k = a_1 \;+\; (a_1 + d) \;+\; (a_1 + 2d) \;+ \cdots \;+\; (a_1 + (n-1)d)$$

Write the terms backwards, starting with a_n,

$$\sum_{k=1}^{n} a_k =$$

Add the two equations together,

Simplify,

Solve for sigma,

$\therefore$, Formula for Sum of the Terms in an Arithmetic Sequence is:

$$\sum_{k=1}^{n} a_k = \frac{n}{2}(a_1 + a_n) \qquad OR \qquad \sum_{k=1}^{n} a_k = \frac{n}{2}(2a_1 + (n-1)d)$$

Example 1:
Find the sum of: $2 + 5 + 8 + 11 + \cdots + 29$

Example 2:
Find the sum of the sequence: $-3, 1, 5, 9, \ldots, 133$

SAT Connection
Solution

The correct answer is 15. The amount, a, that Jane has deposited after t fixed weekly deposits is equal to the initial deposit plus the total amount of money Jane has deposited in the t fixed weekly deposits. This amount a is given to be $a = 18t + 15$. The amount she deposited in the t fixed weekly deposits is the amount of the weekly deposit times t; hence, this amount must be given by the term $18t$ in $a = 18t + 15$ (and so Jane must have deposited 18 dollars each week after the initial deposit). Therefore, the amount of Jane's original deposit, in dollars, is $a - 18t = 15$.
