

10.3 Polar Derivatives Practice Problems*Step-By-Step Multiple-Choice*

Q14: Consider the polar equation $r = 2 \sin \theta$. We can calculate the derivative $\frac{dy}{dx}$ by dividing the derivative $\frac{dy}{d\theta}$ by the derivative $\frac{dx}{d\theta}$.

- To calculate the derivative $\frac{dy}{d\theta}$, we first need to introduce the variable y by multiplying both sides of the equation by $\sin \theta$ and then substituting. Write this equation y in terms of θ .

☐ A $y = 2 \sin 2\theta$

☐ B $y = 2 \sin \theta$

☐ C $y = 4 \sin^2 \theta$

☐ D $y = 2 \sin^2 \theta$

☐ E $y = 2 \sin \theta^2$

- Calculate the derivative $\frac{dy}{d\theta}$.

☐ A $\frac{dy}{d\theta} = 4 \sin \theta \cos \theta$

☐ B $\frac{dy}{d\theta} = 4 \sin \theta$

☐ C $\frac{dy}{d\theta} = 8 \sin \theta \cos \theta$

☐ D $\frac{dy}{d\theta} = 4 \cos 2\theta$

☐ E $\frac{dy}{d\theta} = -4 \sin \theta \cos \theta$

- Similarly, to calculate the derivative $\frac{dx}{d\theta}$, we first need to introduce the variable x by multiplying both sides of the original equation by $\cos \theta$ and then substituting. Write this equation x in terms of θ .

☐ A $x = y \cos \theta$

☐ B $x = 2 \cos \theta$

☐ C $x = 2 \sin \theta$

☐ D $x = 2 \sin \theta \cos \theta$

☐ E $x = -y \cot \theta$

- Calculate the derivative $\frac{dx}{d\theta}$.

☐ A $\frac{dx}{d\theta} = 2 (\cos^2 \theta + \sin^2 \theta)$

☐ B $\frac{dx}{d\theta} = (\cos^2 \theta + \sin^2 \theta)$

☐ C $x = 2 \cos \theta$

☐ D $\frac{dx}{d\theta} = \cos 2\theta$

☐ E $\frac{dx}{d\theta} = 2 \cos 2\theta$

▶ The derivative $\frac{dy}{dx}$ is equal to $\frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}}$. Calculate $\frac{dy}{dx}$.

☐ A $\frac{dy}{dx} = \frac{4 \sin \theta \cos \theta}{2(\cos^2 \theta + \sin^2 \theta)}$

☐ B $\frac{dy}{dx} = \frac{4 \sin \theta \cos \theta}{\cos 2\theta}$

☐ C $\frac{dy}{dx} = \frac{4 \sin \theta \cos \theta}{2 \cos 2\theta}$

☐ D $\frac{dy}{dx} = \frac{-4 \sin \theta \cos \theta}{2 \cos 2\theta}$

☐ E $\frac{dy}{dx} = \frac{-4 \sin \theta \cos \theta}{\cos 2\theta}$

▶ Use the derivative function to calculate the slope of the tangent to $r = 2 \sin \theta$ at $\theta = \frac{\pi}{6}$.

☐ A $\frac{\sqrt{3}}{3}$

☐ B $-\sqrt{3}$

☐ C $\sqrt{3}$

☐ D $2\sqrt{3}$

☐ E $-2\sqrt{3}$

FRQs (Free-Response Questions)

1. Find the point(s) on the curve, $r = 4 \cos \theta$, for $0 \leq \theta < \pi$ where $\frac{dy}{dx} = 0$.

2.  Find the slope of the tangent line to the graph of r , where $r = 2\theta$, in terms of θ .
Find the polar coordinates, $0 \leq \theta < 2\pi$ where the curve has a vertical tangent line.

3. Find the tangent line for the polar curve $r = \theta \cos \theta$ at $\theta = 0$.

Multiple-Choice

4. Find the slope of the tangent line to the curve $r = \frac{1}{\theta}$ at $\theta = \pi$.

- (A) $-\frac{1}{\pi}$
- (B) $-\pi$
- (C) 0
- (D) π
- (E) $\frac{1}{\pi}$

5. Find the slope of the tangent line to the curve $r = \cos \theta$ at $\theta = \frac{\pi}{6}$.

- (A) $-\frac{\sqrt{3}}{3}$
- (B) $-\frac{\sqrt{3}}{4}$
- (C) $-\sqrt{3}$
- (D) $\frac{\sqrt{3}}{3}$
- (E) $\sqrt{3}$
