### 4.4 Optimization Problems

To solve optimization problems,
(1) Draw a picture, ID what we know, ID what we need to find.
(2) Write formula(s).
(3) Express the quantity to be maximized/minimize as a function of one variable.
(4) Find the interval for the variable (if necessary)
(5) Find the max/min (DERIVE!)
(6) Write the answer

## Example 1:

Find the two positive numbers whose sum of the first and twice the second is 100 and the product is a maximum.

Example 2:
Find the dimensions of a rectangle with a perimeter of 100 m , whose area is as large as possible.

## Example 3:

A manufacturer needs to design an open box with a square base and a surface area of $108 \mathrm{in}^{2}$. What dimensions will make a box with a maximum volume?
