

2nd Fundamental Theorem of Calculus

Make a Connection....

1. Given $g(x) = \int_3^x (t^2 - 2) dt$ find $g'(x)$.

$$\begin{aligned} &= (\frac{1}{3}t^3 - 2t) \Big|_3^x \\ &= \frac{1}{3}x^3 - 2x - (\frac{1}{3}(3)^3 - 2(3)) \\ &= \frac{1}{3}x^3 - 2x - 9 + 6 \\ g(x) &= \frac{1}{3}x^3 - 2x - 3 \end{aligned}$$

$$\begin{aligned} g'(x) &= \frac{1}{3}(3x^2) - 2 \\ g'(x) &= x^2 - 2 \end{aligned}$$

2. In problem #1, can you see a connection between $g(x)$ and $g'(x)$? If yes, find $g'(x)$ in one step for each problem below.

a) $g(x) = \int_4^x (3t^2 - 2) dt$ b) $g(x) = \int_5^x (3t^2 - 2t) dt$

$$g'(x) = 3x^2 - 2$$

$$g'(x) = 3x^2 - 2x$$

3. For $g(x) = \int_3^{x^2} (t^2 - 2) dt$, $g'(x) = 2x^5 - 4x$. Does your method apply to this problem?
 $= 2x(x^4 - 2)$ If not, how can you fix your method?

$$\begin{aligned} g'(x) &= ((x^2)^2 - 2) \cdot 2x \\ &= (x^4 - 2) 2x \\ &= 2x^5 - 4x \end{aligned}$$

2nd FTC

If f is continuous on $[a, b]$ and *variable*

$$F(x) = \int_a^x f(t) dt \quad \text{is constant } \forall x \text{ in } [a, b]$$

then $F'(x) = \frac{d}{dx} \int_a^x f(t) dt$

$$F'(x) = f(x)$$

and if $F(x) = \int_a^{g(x)} f(t) dt$ *function* $\forall x \text{ in } [a, b]$

then $F'(x) = \frac{d}{dx} \int_a^{g(x)} f(t) dt$

$$F'(x) = f(g(x)) \cdot g'(x)$$

• Example 1:

Find $F'(x)$ where $F(x) = \int_x^{\pi} \sqrt{1 + \sec t} dt$.

$$\begin{aligned} &= - \int_x^{\pi} \sqrt{1 + \sec t} dt \\ F'(x) &= - \frac{d}{dx} \left(\int_x^{\pi} \sqrt{1 + \sec t} dt \right) \end{aligned}$$

$$F'(x) = -\sqrt{1 + \sec x}$$

• Example 2:

If $h(x) = \int_1^{\tan x} \sqrt{t + \sqrt{t}} dt$, find $h'(x)$.

$$h'(x) = \sqrt{\tan x + \sqrt{\tan x}} \cdot \sec^2 x$$

• Example 3:

Given $y = \int_{e^x}^0 \sin^3 t dt$, find $\frac{dy}{dx}$.

$$\begin{aligned} &= - \int_0^{e^x} \sin^3 t dt \\ \frac{dy}{dx} &= - \sin^3 e^x \cdot e^x \rightarrow \boxed{\frac{dy}{dx} = -e^x \sin^3 e^x} \end{aligned}$$

• Example 4:

Find $\frac{d}{dx} \int_4^{3x} \cos t dt$.

$$\begin{aligned} \frac{d}{dx} \int_4^{3x} \cos t dt &= \cos 3x \cdot 3 \\ &= \boxed{3 \cos 3x} \end{aligned}$$

• Example 5:

If $g(x) = \int_{2x}^{3x} \frac{t^2-1}{t^2+1} dt$, find $g'(x)$.

$$\begin{aligned} &= \int_{2x}^c \frac{t^2-1}{t^2+1} dt + \int_c^{3x} \frac{t^2-1}{t^2+1} dt \\ &= - \int_c^{2x} \frac{t^2-1}{t^2+1} dt + \int_c^{3x} \frac{t^2-1}{t^2+1} dt \\ g'(x) &= - \frac{(2x)^2-1}{(2x)^2+1} \cdot 2 + \frac{(3x)^2-1}{(3x)^2+1} \cdot 3 \end{aligned}$$

$$= -2 \cdot \frac{4x^2-1}{4x^2+1} + 3 \cdot \frac{9x^2-1}{9x^2+1}$$

$$g'(x) = \frac{-8x^2+2}{4x^2+1} + \frac{27x^2-3}{9x^2+1}$$
