Lengths of Curves

Estimate the length of the curve $y = x^2$ on $[1, 3]$.

$$\begin{aligned}
 \text{length of curve} &= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} \quad \text{--- (1)} \\
 &\approx \sqrt{(2-1)^2 + (4-1)^2} + \sqrt{(3-2)^2 + (9-4)^2} \\
 &\approx \sqrt{1+9} + \sqrt{1+25} \\
 &\approx \sqrt{10} + \sqrt{26} \\
 &\approx 8.261
 \end{aligned}$$

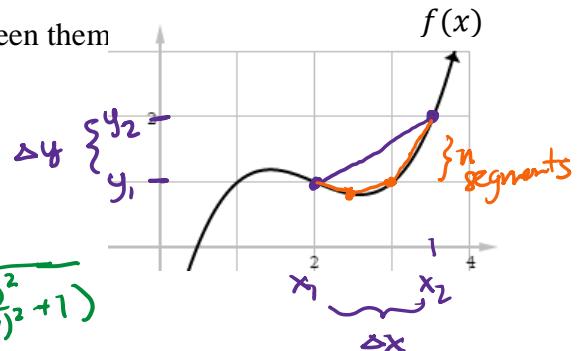

Finding the Length of a Curve

Given 2 points (x_1, y_1) and (x_2, y_2) , find the distance between them

$$\begin{aligned}
 \text{Distance} &= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} \\
 &= \sqrt{(\Delta x)^2 + (\Delta y)^2} \\
 &= \sqrt{(\Delta x)^2 \left(1 + \frac{(\Delta y)^2}{(\Delta x)^2}\right)} \quad \text{or } \sqrt{(\Delta y)^2 \left(\frac{(\Delta x)^2}{(\Delta y)^2} + 1\right)} \\
 &= \Delta x \sqrt{1 + \left(\frac{\Delta y}{\Delta x}\right)^2} \quad = \Delta y \sqrt{\left(\frac{\Delta x}{\Delta y}\right)^2 + 1}
 \end{aligned}$$

$$\text{Sum of } n \text{ segments} = \sum_{k=1}^n \sqrt{1 + \left(\frac{\Delta y}{\Delta x}\right)^2} \Delta x \quad \sum \sqrt{\left(\frac{\Delta x}{\Delta y}\right)^2 + 1} \cdot \Delta y$$

Sum of infinite # of segments

$$\begin{aligned}
 &= \lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{1 + \left(\frac{\Delta y}{\Delta x}\right)^2} \Delta x \quad \lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{\left(\frac{\Delta x}{\Delta y}\right)^2 + 1} \cdot \Delta y \\
 &= \lim_{\Delta x \rightarrow 0} \sum_{k=1}^n \sqrt{1 + \left(\frac{\Delta y}{\Delta x}\right)^2} \Delta x \quad \lim_{\Delta x \rightarrow 0} \sum_{k=1}^n \sqrt{\left(\frac{\Delta x}{\Delta y}\right)^2 + 1} \cdot \Delta y
 \end{aligned}$$

Look familiar?

Length of a Curve

Length of a Curve =
(Arc Length)

$$\int_a^b \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx$$

OR

$$\int_c^d \sqrt{\left(\frac{dx}{dy}\right)^2 + 1} dy$$

Example 1:

- Find the length of the curve $y = x^2$ on $[1, 3]$.

$$\text{length of curve} = \int_1^3 \sqrt{1 + (2x)^2} dx$$

$$= 8.268$$

$$\text{length curve} = \int_a^b \sqrt{1 + (\frac{dy}{dx})^2} dx$$

Example 2:

- Find the length of the curve $x = \sin y$ from $y = 0$ to $y = \frac{\pi}{2}$.

$$\text{length of curve} = \int_0^{\frac{\pi}{2}} \sqrt{(\cos y)^2 + 1} dy$$

$$= 1.910$$

$$\text{length curve} = \int_c^d \sqrt{(\frac{dx}{dy})^2 + 1} dy$$

Example 3:

- Find the length of the curve $y = \frac{1}{3}(x^2 + 2)^{3/2}$ on $[0, 3]$.

$$\frac{dy}{dx} = 2x \cdot \frac{1}{3} \cdot \frac{3}{2} (x^2 + 2)^{\frac{1}{2}}$$

$$= x(x^2 + 2)^{\frac{1}{2}}$$

$$\text{length curve} = \int_0^3 \sqrt{1 + (x(x^2 + 2)^{\frac{1}{2}})^2} dx$$

$$= \int_0^3 \sqrt{1 + x^2(x^2 + 2)} dx$$

$$= \int_0^3 \sqrt{1 + x^4 + 2x^2} dx$$

$$= \int_0^3 \sqrt{x^4 + 2x^2 + 1} dx$$

$$\text{length curve} = \int_a^b \sqrt{1 + (\frac{dy}{dx})^2} dx$$

$$\begin{aligned} &= \int_0^3 \sqrt{(x^2 + 1)(x^2 + 1)} dx \\ &= \int_0^3 \sqrt{(x^2 + 1)^2} dx \\ &= \int_0^3 (x^2 + 1) dx \\ &= \left(\frac{1}{3}x^3 + x \right) \Big|_0^3 \\ &= 9 + 3 - 0 = \boxed{12} \end{aligned}$$

Example 4:

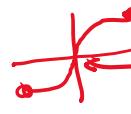

- Find the length of the curve $y = 2x^{1/5}$ from $(-32, -4)$ to $(32, 4)$.

$$\frac{dy}{dx} = \frac{2}{5}x^{-\frac{4}{5}}$$

$$\text{length curve} = \int_{-32}^{32} \sqrt{1 + (\frac{2}{5}x^{-\frac{4}{5}})^2} dx$$

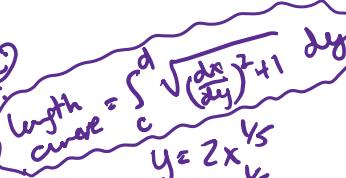

$$\text{length curve} = \int_a^b \sqrt{1 + (\frac{dy}{dx})^2} dx$$

uh oh... $\frac{dy}{dx}$ DNE at $x=0$ (which is in interval $(-32, 32)$)

 vertical tangent line
at $x=0$

use inverse

 then no DNE anymore

$$\text{length curve} = \int_c^d \sqrt{(\frac{dx}{dy})^2 + 1} dy$$

$$y = 2x^{1/5}$$

$$\frac{1}{5}y^5 = x$$

$$\frac{1}{32}y^4 = x$$

$$\frac{dx}{dy} = \frac{5}{32}y^4$$

$$\text{length of curve} = \int_{-4}^4 \sqrt{(\frac{5}{32}y^4)^2 + 1} dy$$

$$= \boxed{67.172}$$
