

7.4 Partial Fractions

Target 8G: Decompose rational expressions into partial fractions

Review of Prior Concepts

Simplify.

1. $\frac{3}{5} + \frac{21}{4}$
 $= \frac{(4)3}{(4)5} + \frac{21(5)}{4(5)}$
 $= \frac{12}{20} + \frac{105}{20}$
 $= \frac{117}{20}$

2. $\frac{(x-2)^2}{(x-2)x} + \frac{1(x)}{(x-2)(x)}$
 $= \frac{2x-4}{x(x-2)} + \frac{x}{x(x-2)}$
 $= \frac{3x-4}{x(x-2)}$ or $\frac{3x-4}{x^2-2x}$

Partial Fraction Decomposition

To **decompose a fraction** – write one fraction as the sum/difference of 2 or more fractions.

Example:

Write the terms for partial fraction

decomposition of: $\frac{x-3}{x^2+3x}$

① Factor the denominator.

② Write each factor in its own fraction w/numerator as function that is one degree less than denominator.

A, B, C, etc... are constants (#s)

① $\frac{x-3}{x(x+3)}$

② $\frac{x-3}{x(x+3)} = \frac{A}{x} + \frac{B}{x+3}$

constants have degree of 0.
 degree is 1, ∴, numerator degree is 0.

More Examples:

Write the terms for partial fraction decomposition of each:

1. $\frac{x-14}{x^2-4}$

① $\frac{x-14}{(x-2)(x+2)}$

② $\frac{x-14}{(x-2)(x+2)} = \frac{A}{x-2} + \frac{B}{x+2}$

2. $\frac{4x+4}{x^3+2x^2}$

① $\frac{4x+4}{x^2(x+2)}$

② $\frac{4x+4}{x^2(x+2)} = \frac{A+B}{x^2} + \frac{C}{x+2}$ where A, B, C are #s

∴, degree 1
 degree 2

3. $\frac{3x^2+4}{(x-3)(x+5)(x^2+1)}$

Handwritten partial fraction decomposition for problem 3:

$$\frac{3x^2+4}{(x-3)(x+5)(x^2+1)} = \frac{A}{x-3} + \frac{B}{x+5} + \frac{Cx+D}{x^2+1}$$

Annotations: "already factored" (pointing to denominator), "degree 0" (pointing to A), "degree 1" (pointing to B), "degree 2" (pointing to Cx+D).

4. $\frac{5x^3-10x^2-5x-5}{(x^2+9)(x^2+4)}$

Handwritten partial fraction decomposition for problem 4:

$$\frac{5x^3-10x^2-5x-5}{(x^2+9)(x^2+4)} = \frac{Ax+B}{x^2+9} + \frac{Cx+D}{x^2+4}$$

Annotations: "already factored" (pointing to denominator), "degree 1" (pointing to Ax+B), "degree 2" (pointing to Cx+D).

Decompose the fraction

Example:

Decompose: $\frac{x-3}{x^2+3x}$

- ① Factor the denominator.
- ② Write each factor in its own fraction w/numerator as function that is one degree less than denominator.
- ③ Solve for the constants: A,B,C, etc.
- ④ Write original fraction as decomposed fractions (partial fractions)

Handwritten solution for the example problem:

- ① $\frac{x-3}{x(x+3)}$
- ② $\frac{x-3}{x(x+3)} = \frac{A}{x} + \frac{B}{x+3}$
- ③ $\frac{x(x+3)}{x(x+3)} \cdot \frac{x-3}{x(x+3)} = \frac{A(x)(x+3)}{x} + \frac{B(x)(x+3)}{x+3}$
 $x-3 = A(x+3) + B(x)$
 $x-3 = Ax+3A+Bx$
 $x-3 = (A+B)x + 3A$
 $A+B=1 \quad -3=3A$
 $-1+B=1 \quad -1=A$
 $B=2$
- ④ $\frac{x-3}{x^2+3x} = \frac{-1}{x} + \frac{2}{x+3}$

Thought bubble: constants = constants, linear coeff = linear coeff

More Examples:

Decompose each fraction.

1. $\frac{x-14}{x^2-4}$

① $\frac{x-14}{(x-2)(x+2)}$

② $\frac{x-14}{(x-2)(x+2)} = \frac{A}{x-2} + \frac{B}{x+2}$

③ $\frac{x-14}{(x-2)(x+2)} = \frac{A(x+2)}{x-2} + \frac{B(x-2)}{x+2}$

$$x-14 = A(x+2) + B(x-2)$$

$$x-14 = Ax + 2A + Bx - 2B$$

$$x-14 = (A+B)x + 2A-2B$$

$$A+B=1 \quad 2A-2B=-14$$

$$A+B=1 \quad A-B=-7$$

$$A+B=1 \quad A-B=-7$$

$$\frac{A+B=1}{A-B=-7} \quad \frac{A+B=1}{-3+B=1}$$

$$2A=-6 \quad -3+B=1$$

$$A=-3 \quad B=4$$

$$\frac{x-14}{x^2-4} = \frac{-3}{x-2} + \frac{4}{x+2}$$

2. $\frac{7x-7}{x^2-3x-10}$

① $\frac{7x-7}{(x-5)(x+2)}$

② $\frac{7x-7}{(x-5)(x+2)} = \frac{A}{x-5} + \frac{B}{x+2}$

③ $\frac{7x-7}{(x-5)(x+2)} = \frac{A(x+2)}{x-5} + \frac{B(x-5)}{x+2}$

$$7x-7 = A(x+2) + B(x-5)$$

$$7x-7 = Ax + 2A + Bx - 5B$$

$$7x-7 = (A+B)x + 2A-5B$$

$$A+B=7 \quad 2A-5B=-7$$

$$A=7-B \quad 2(7-B)-5B=-7$$

$$A=7-B \quad 14-2B-5B=-7$$

$$A=7-3 \quad -7B=-21$$

$$A=4 \quad B=3$$

$$\frac{7x-7}{x^2-3x-10} = \frac{4}{x-5} + \frac{3}{x+2}$$
