

**9.4 Sequences & Series**

Target 7B: Generate and identify the explicit rule for arithmetic sequences and series

*Review of Prior Concepts*1. Find the 17<sup>th</sup> term of:  
 $(2x - y)^{24}$ 2. Find the sum of the coefficients of:  
 $(2x - y)^3$ **More Practice****Binomial Expansion**<http://www.purplemath.com/modules/binomial2.htm><https://www.mathsisfun.com/algebra/binomial-theorem.html><https://braingenie.ck12.org/skills/106589><https://www.khanacademy.org/math/algebra2/polynomial-functions/binomial-theorem/v/coefficient-in-binomial-expansion><https://youtu.be/--3KJdcbJ0g><https://youtu.be/fndaGW7Tcz0>**SAT Connection****Heart of Algebra**

8. Interpret the variables and constants in expressions for linear functions within the context presented.

Example:

Kathy is a repair technician for a phone company. Each week, she receives a batch of phones that need repairs. The number of phones that she has left to fix at the end of each day can be estimated with the equation  $P = 108 - 23d$ , where  $P$  is the number of phones left and  $d$  is the number of days she has worked that week. What is the meaning of the value 108 in this equation?

- A) Kathy will complete the repairs within 108 days.
- B) Kathy starts each week with 108 phones to fix.
- C) Kathy repairs phones at a rate of 108 per hour.
- D) Kathy repairs phones at a rate of 108 per day.

[Solution](#)

## Sequences

**Sequence** – ordered progression of numbers

- Infinite – unmeasurable or infinite # of terms

*Example:* 2,4,8,16, ...,  $2^k$ , ...

- Finite – countable or a set # of terms

*Example:* 2,4,8,16,32

Terms of sequences:  $k^{\text{th}}$  term = \_\_\_\_\_  $n^{\text{th}}$  term = \_\_\_\_\_

*Example:* Find the 3<sup>rd</sup> term in the sequence: 2,4,8,16,32

## Defining Sequences

**Recursively-Defined Sequence** – Each term depends on previous term(s)

*Example 1:* Given  $a_n = 3a_{n-1}$  where  $a_1 = 2$  and  $n \geq 2$ , find  $a_4$

*Example 2:* Given  $a_n = a_{n-1} - 5$  where  $a_1 = 11$  and  $n \geq 2$ , find the 4<sup>th</sup> and 8<sup>th</sup> terms.

**Explicitly-Defined Sequence** – Terms based on  $n$

*Example:* Given  $a_n = -5n + 16$ , find the 4<sup>th</sup> and 8<sup>th</sup> terms.

### Arithmetic Sequence

**Arithmetic Sequence** – sequence written as  $\{a, a + d, a + 2d, a + 3d, \dots, a + (n - 1)d, \dots\}$

Explicit Rule

$$a_n = a_1 + (n - 1)d$$

Recursive Rule

$$a_n = a_{n-1} + d, \quad \text{for all } n \geq 2$$

*Example 1:* Find the common difference and 10<sup>th</sup> term, and write a recursive rule and explicit rule for the sequence: 7, 20, 33, ...

*Example 2:* Find the common difference and 10<sup>th</sup> term, and write a recursive rule and explicit rule for the sequence:  $\ln 3, \ln 6, \ln 12, \ln 24, \dots$

#### Homework Assignment

p.746 #1–13odd, 19

**SAT Connection****Solution**

**Choice B is correct.** The value 108 in the equation is the value of  $P$  in  $P = 108 - 23d$  when  $d = 0$ . When  $d = 0$ , Kathy has worked 0 days that week. In other words, 108 is the number of phones left before Kathy has started work for the week. Therefore, the meaning of the value 108 in the equation is that Kathy starts each week with 108 phones to fix because she has worked 0 days and has 108 phones left to fix.

Choice A is incorrect because Kathy will complete the repairs when  $P = 0$ . Since  $P = 108 - 23d$ , this will occur when  $0 = 108 - 23d$  or when  $d = \frac{108}{23}$ , not when  $d = 108$ . Therefore, the value 108 in the equation does not represent the number of days it will take Kathy to complete the repairs. Choices C and D are incorrect because the number 23 in  $P = 108 - 23d$  indicates that the number of phones left will decrease by 23 for each increase in the value of  $d$  by 1; in other words, that Kathy is repairing phones at a rate of 23 per day, not 108 per hour (choice C) or 108 per day (choice D).
