Topic 2: Graphs of f, f', and f''
Interpreting from Graphs & Tables of Values

There are a variety of question types here. Students may be given an equation of the function or its derivative and asked for the location of extreme values, intervals where the function is increasing or decreasing, concavity, etc. Students may be given the graph of the derivative and asked the same kinds of things. They may be asked to find the value of the integral given the graph but no equation.

This may be a particle motion problem where the velocity is given as a graph.

What students should know how to do:

- Reading information about the function from the graph of the derivative. This may be approached as a derivative techniques or antiderivative techniques.
- Find and justify extreme values (1st DT, 2nd DT, Closed interval test (aka. Candidates' test).
- Find and justify points of inflection.
- Write an equation of tangent line
- Evaluate Riemann sums from graphs only.
- FTC: Evaluate integral from area of regions on the graph.
- FTC: Realize that if $g(x) = g(a) + \int_a^t f(t)\,dt$, then $g'(x) = f(x)$
- "Family of functions": functions with a parameter;
- Functions defined by other functions.

Tables may be used to test a variety of ideas in calculus including analysis of functions, accumulation, position-velocity-acceleration, *et al*.

What students should be able to do:
- Approximate the derivative using a difference quotient.
- Use Riemann sums (left, right, midpoint) or a trapezoidal approximation to approximate the value of a definite integral using values in the table (typically with uneven subintervals). (Trapezoidal Rule, *per se*, is not required.)
- Average value and the MVT may appear
- Questions about the Rolle's theorem, MVT, IVT, etc.

Do not: Use a calculator to find a regression equation and then use that to answer parts of the question. (While finding them ids perfectly good mathematics, regression equations are not one of the four things students may do with their calculator and give only an approximation of our function.)

Graph of f

4. The graph of a differentiable function f on the closed interval $[-3, 15]$ is shown in the figure above. The graph of f has a horizontal tangent line at $x = 6$. Let $g(x) = 5 + \int_6^x f(t)\,dt$ for $-3 \le x \le 15$.

   $\rightarrow f'(6) = 0$

(a) Find $g(6)$, $g'(6)$, and $g''(6)$.

$g(6) = 5 + \int_6^6 f(t)\,dt$

$= 5 + 0$

$\boxed{g(6) = 5}$

$g'(x) = \frac{d}{dx}\left(5 + \int_6^x f(t)\,dt\right)$

$g'(x) = f(x)$

$g'(6) = f(6)$

$\boxed{g'(6) = 3}$

$g''(x) = f'(x)$

$g''(6) = f'(6)$

$\boxed{g''(6) = 0}$

1pt: $g(6)$
1pt: $g'(6)$
1pt: $g''(6)$

Work for problem 4 (b) On what intervals is g decreasing? Justify your answer.

$g' = f$ ☺

$g' < 0$

g dec on $[-3, 0) \cup (12, 15]$

b/c $g' < 0$ on $[-3, 0) \cup (12, 15]$

1pt: $[-3, 0)$
1pt: $(12, 15]$
1pt: reason

Work for problem 4 (c) On what intervals is the graph of g concave down? Justify your answer.

$g'' < 0 \rightarrow g'$ decreasing

g concave down on $(6, 15)$

b/c g' decreasing on $(6, 15)$

1pt: interval
1pt: reason

Work for problem 4 (d) Find a trapezoidal approximation of $\int_{-3}^{15} f(t)\,dt$ using six subintervals of length $\Delta t = 3$.

equal subintervals

Δt

$$\int_{-3}^{15} f(t)\,dt = \frac{1}{2}(3)\left[-1 + 2(0) + 2(1) + 2(3) + 2(1) + 2(0) + -1\right]$$

ok to stop here

4. Let f be the function defined for $x > 0$, with $f(e) = 2$ and f', the first derivative of f, given by $f'(x) = x^2 \ln x$.

(a) Write an equation for the line tangent to the graph of f at the point $(e, 2)$.

$\hookrightarrow y - y_1 = m(x - x_1)$

$x_1 \quad y_1$

$y - 2 = e^2(x - e)$

$f'(e) = e^2 \ln e$

$= e^2$

1pt : $f'(e)$
1pt : tangent line equation

(b) Is the graph of f concave up or concave down on the interval $1 < x < 3$? Give a reason for your answer.

$f'' > 0 \qquad f'' < 0$

$f''(x) = \ln x (2x) + x^2 \left(\frac{1}{x}\right)$

$= 2x \ln x + x$

$f'' \quad \xrightarrow{\qquad + \qquad}$
$\quad 1 \quad ② \quad 3$

f concave up on $(1,3)$

b/c $f'' > 0$ on $(1,3)$

2pts : $f''(x)$

1pt : answer w/ reason

Do not write beyond this border.

(c) Use antidifferentiation to find $f(x)$.

$$f'(x) = x^2 \ln x$$

$$\int f'(x)\, dx = \int x^2 \ln x\, dx$$

$$u = \ln x \qquad dv = x^2\, dx$$
$$du = \frac{1}{x}\, dx \qquad v = \frac{1}{3} x^3$$

$$\boxed{uv - \int v\, du} \cdots \smiley$$

$$f(x) = \ln x \cdot \frac{1}{3} x^3 - \int \frac{1}{3} x^3 \cdot \frac{1}{x}\, dx$$

$$= \frac{1}{3} x^3 \ln x - \int \frac{1}{3} x^2\, dx$$

$$f(x) = \frac{1}{3} x^3 \ln x - \frac{1}{9} x^3 + C$$

← 2pts: antiderive correctly

$$f(e) = \frac{1}{3} e^3 \ln e - \frac{1}{9} e^3 + C$$

$$2 = \frac{1}{3} e^3 - \frac{1}{9} e^3 + C$$

$$2 - \frac{1}{3} e^3 + \frac{1}{9} e^3 = C$$

1pt: use initial condition $(e, 2)$

$$\boxed{f(x) = \frac{1}{3} x^3 \ln x - \frac{1}{9} x^3 + 2 - \frac{1}{3} e^3 + \frac{1}{9} e^3}$$

1pt: answer

OR

$$\frac{1}{3} x^3 \ln x - \frac{1}{9} x^3 + 2 - \frac{2}{9} e^3$$
